Summary

Infrastructure engineer with **6 years of experience** building and maintaining cloud infrastructure across AWS, GCP, and Azure. I focus on the unglamorous work that keeps production systems running: reliable CI/CD pipelines, observable services, and infrastructure that the next person can actually understand and modify. Comfortable owning the full lifecycle from architecture through delivery and knowledge transfer. Active open-source contributor with a particular interest in developer tooling and automation.

Core Skills

Languages: Python, Go, HCL (Terraform), Bash

Cloud: AWS (EC2, ECS, Lambda, S3, RDS, EKS), GCP (Compute Engine, GKE, Cloud SQL, Cloud Run), Azure (VMs, AKS, Blob Storage)

Infra as Code: Terraform, Pulumi, CloudFormation, Helm, Ansible

CI/CD: GitHub Actions, GitLab CI/CD, CircleCI, ArgoCD

Observability: Prometheus, Grafana, OpenTelemetry, ELK Stack, Datadog

Containers: Docker, Kubernetes, Helm, Kaniko, Buildah

Work Experience

Senior DevOps Engineer | Meridian Health Systems | Remote | 2021 - Present

- Own the AWS infrastructure for a HIPAA-adjacent data pipeline processing roughly 800K patient records per day. Reduced pipeline failures by redesigning the retry logic and adding dead-letter queues with SQS.
- Migrated the CI/CD system from Jenkins to GitHub Actions across 40+ repositories. Cut average build time from 18 minutes to around 4 minutes by parallelizing test suites and switching to Kaniko for container image builds.
- Built a Grafana + Prometheus observability stack from scratch for the platform team. On-call rotation went from dreading pagers to mostly ignoring them during off-hours.
- Lead infrastructure work on a client engagement involving GCP and Kubernetes. Scoped the architecture, handed off to the client's team, and ran weekly knowledge-transfer sessions for three months until they were confident maintaining it independently.
- Contributed a fix to the Pulumi Kubernetes provider that resolved a bug in Helm chart rendering for a downstream open-source project used by about 200 internal teams.

Platform Engineer | Stackforge Inc. | Remote | 2018 - 2021

- Maintained Kubernetes clusters on AWS EKS (three environments: dev, staging, prod) serving a SaaS product with around 60K active users. Kept uptime at 99.9% across an 18-month period with zero P0 incidents.
- Rewrote the infrastructure provisioning scripts that were a tangled mess of bash and the AWS CLI. Replaced them with **Python** modules using the boto3 library and Terraform. New environment spin-up went from a manual two-day process to about 45 minutes.
- Introduced Terraform for managing all AWS resources. Before this, infrastructure changes were made by hand through the console, and nobody was quite sure what the production state actually was.
- Set up Vault for secrets management across the engineering org. Integrated it with Kubernetes so workloads could fetch secrets at startup without static credentials sitting in environment variables.
- Mentored two junior engineers on Kubernetes basics and CI/CD tooling. Both eventually led their own feature areas without needing hand-holding after about six months.

Education

BS Computer Science | University of Texas at Austin | 2014 - 2018
