

Nathan Hershey

Round Rock, TX | nathanhershey047@gmail.com | 937-326-3137 | <https://www.linkedin.com/in/nathan-hershey-436209388>

Summary

Full stack engineer with **8 years of experience** building **web applications** across the complete development lifecycle, from API design through frontend delivery. Strongest in **Python** and **Node.js** with solid hands-on depth in **React**, relational databases, and cloud-native deployment patterns. Has owned backend services, rebuilt internal tooling, and worked closely with product and QA teams to ship features on time in fast-moving environments.

Core Skills

Languages: Python, Node.js, JavaScript (ES6+), TypeScript, PHP, SQL

Frontend: React, Vue.js, HTML5, CSS3, SASS/LESS, Responsive Design

Backend: Express.js, Django, Laravel, REST APIs, GraphQL, WebSockets

Databases: PostgreSQL, MySQL, Redis, MongoDB

DevOps / Infra: Docker, CI/CD (GitHub Actions), AWS (EC2, ECS, S3, Lambda), Linux

Tools: Git, Agile/Scrum, Jira, OAuth2, JWT, PHPUnit, Jest, Cypress

Work Experience

Senior Full Stack Engineer | Frontdoor | Remote | 09/2022 - Present

- Led development on the Frontdoor home services platform, owning backend services that handled scheduling, dispatch, and customer communications for real estate and home service workflows.
- Designed and shipped **RESTful APIs** in **Python** and **Node.js** for internal tools used by around 40+ support and operations staff daily.
- Rebuilt the React-based customer dashboard, migrating from a legacy jQuery frontend. The new interface cut average page load times from roughly 4s to about 1.5s.
- Optimized **PostgreSQL** schemas and query patterns for the dispatch and reporting modules. Index tuning on the core scheduling tables reduced average query time by around 60% during peak hours.
- Owned the backend service layer for customer communication features, handling roughly 3 million records across the reporting and notification pipeline.
- Set up **CI/CD pipelines** with GitHub Actions and **Docker**, cutting release cycle from about 2 weeks to weekly deploys.
- Collaborated with product managers and QA to gather requirements, estimate sprint work, and deliver new features in 2-week cycles with zero major incidents on the critical path.
- Mentored two junior developers on **React** patterns and **API design** best practices, conducting weekly code reviews until both were independently shipping features.

Full Stack Developer | ZenBusiness | Remote | 01/2021 - 11/2022

- Owned the entity formation service backend, a **Node.js** microservice handling business registration workflows for small businesses and entrepreneurs. Maintained 99.9% uptime across roughly 18 months.
- Built a new GraphQL API layer in **Node.js** to replace a fragmented set of REST endpoints, giving the frontend team a unified data-fetching interface and reducing over-fetching by an estimated 40%.
- Migrated a monolithic application to **microservices on AWS ECS** using **Docker** containers. Deployment time dropped from around 30 minutes per release to about 5 minutes.
- Contributed to **React** frontend components for the ZenBusiness marketing and customer portal, working alongside designers to implement new page layouts and improve conversion flows.
- Configured a **CI/CD pipeline** with GitHub Actions and automated testing gates, catching regressions before they reached production and reducing on-call incidents by roughly 30%.

- Wrote Python automation scripts for internal compliance checks and SSL monitoring, saving roughly 2 hours per week of manual DevOps work.

Full Stack Engineer | Northstar Software Development | Hybrid | 11/2020 - 06/2021

- Built React components for an ATS (applicant tracking system) used by HR teams to manage job postings, candidate pipelines, and interview scheduling.
- Designed **PostgreSQL** schemas and Eloquent-style models for the ATS data layer, optimizing join-heavy queries that cut average response times by roughly half.
- Developed **REST APIs** in **Node.js** and Express to serve the React frontend, handling CRUD operations for jobs, candidates, and interview records.
- Worked directly with HR stakeholders to translate workflow requirements into technical specs, narrowing the gap between what HR needed and what the team shipped.
- Implemented role-based access control across the API layer, ensuring hiring managers and recruiters saw only the data appropriate to their level.

Software Engineer | Arbisoft | Hybrid | 10/2018 - 08/2020

- Developed the FixAlert notification platform frontend in **React**, handling webhook ingestion and real-time alerting for monitoring workflows.
- Built backend logic in **Python** for the FixAlert core, including event processing, retry queues, and subscriber management.
- Integrated third-party APIs via webhooks, normalizing payloads and routing events to the correct notification channels for around 500 customers.
- Improved the React dashboard's responsiveness and layout, contributing to a measurable bump in user engagement metrics over the following quarter.
- Containerized the FixAlert deployment with **Docker** and **AWS ECS**, streamlining local development and CI testing across 5 engineers.
- Wrote Python automation scripts for testing and deployment workflows, reducing manual setup steps during sprint releases.

Education

BS Computer Science | University of North Texas | 2014 - 2018
