

Nathan Hershey

Round Rock, TX | nathanhershey047@gmail.com | 937-326-3137 | <https://www.linkedin.com/in/nathan-hershey-436209388>

Summary

Full stack web developer with **8 years of experience** building and maintaining modern web applications. Focused on **Python**, **Node.js**, and **React**, with strong hands-on expertise in **PHP/Laravel**, **WordPress**, and relational databases. Delivered scalable solutions across SaaS platforms, real estate financial tools, and monitoring systems, working closely with product, design, and QA teams to ship reliable features on time.

Core Skills

Languages: PHP, Laravel, Python, JavaScript (ES6+), TypeScript, SQL

Frontend: React, Vue.js, WordPress, HTML5, CSS3, SASS/LESS, Redux

Backend: Node.js, Express, Python, Django, PHP/Laravel, REST APIs, GraphQL

Database: MySQL, PostgreSQL, Redis, MongoDB

Infra: Docker, AWS ECS, CI/CD, Git, Linux

Testing: Jest, PHPUnit, Cypress, React Testing Library

Education

BS Computer Science | University of North Texas | 2014 - 2020

Work Experience

Senior Full Stack Engineer | Frontdoor | Remote | 09/2022 - Present

- Led migration of the property management platform from legacy jQuery to **React** with TypeScript, improving frontend maintainability and cutting average page load times.
- Architected **12+ RESTful APIs** in **Node.js** to handle property valuations, mortgage calculations, and third-party integrations with OAuth2 authentication, enabling real-time financial data synchronization across multiple lenders.
- Built **Python**-based document processing services for mortgage and title workflows, reducing manual review time from around 4 hours per day to under an hour.
- Developed automated testing suites with Jest and React Testing Library, raising code coverage from roughly 40% to 75% and catching regressions before deployment.
- Containerized applications using **Docker** and deployed to **AWS ECS**, improving system uptime and simplifying the release process for a 5-person engineering team.
- Designed **PostgreSQL** schema for financial data with proper indexing, achieving query p99 times under 150 ms during peak traffic.
- Implemented Redis caching for frequently accessed property data, reducing database load by about 40% during high-traffic windows.
- Collaborated with product managers, compliance teams, and QA engineers to plan quarterly releases for the real estate financial platform.

Full Stack Developer | ZenBusiness | Hybrid | 01/2021 - 11/2022

- Built backend services in **PHP/Laravel** for business registration and compliance workflows, handling entity formation, EIN acquisition, and document management for thousands of customers.
- Integrated state APIs for real-time filing status tracking, processing over 1,000 filings per day without manual intervention.
- Developed **Vue.js** components for the user registration flow, reducing abandonment during onboarding by roughly 25%.
- Maintained WordPress multisite infrastructure serving 50,000+ business customers, writing custom REST endpoints for internal tooling and external integrations.
- Added Redis caching and optimized MySQL query patterns, keeping the platform responsive through Black Friday traffic spikes without downtime.
- Set up Git workflows and CI/CD pipelines for an 8-person team, cutting average deploy time from around 30 minutes to under 10.

Full Stack Engineer | Northstar Software Development | Remote | 11/2020 - 06/2021

- Maintained an ATS platform in **PHP/Laravel** for a 40-person recruiting team, building RESTful APIs and Vue.js frontend features used daily across the organization.
- Worked with recruiters and hiring managers to automate job posting workflows, saving several hours of manual work per week.
- Refactored database queries to cut average page load times by around 40%, making candidate lookups noticeably faster for end users.
- Conducted code reviews and introduced PHPUnit testing standards, which helped reduce production bugs over the following months.
- Wrote Python scripts to automate importing candidate data from external job boards, eliminating a manual 2-hour weekly task.

Software Engineer | Arbisoft | Remote | 10/2018 - 08/2020

- Built FixAlert, a real-time web application monitoring platform, using **Node.js** and Express to track application health and alert on anomalies.
- Developed **8+ RESTful APIs** for alert configuration, user management, and notification delivery.
- Built the frontend dashboard in **React** and Redux, replacing a scattered collection of legacy pages with a cohesive monitoring interface.
- Implemented WebSocket notifications for real-time alert delivery, reducing incident response time by helping on-call engineers catch issues within seconds instead of minutes.
- Integrated Datadog and Grafana for comprehensive application monitoring, improving visibility across the engineering team.
- Optimized MySQL queries and schema, bringing average page load times down from 5s to around 1s for the alert history view.
